TPM Academy

Customer: Expeditors **Source outline:** `outline.pdf` **Glossary & acronyms:** `GLOSSARY.md`

An 8-week immersive Technical Product Manager Academy preparing engineers, analysts, and associate PMs to operate as Technical Product Managers. Every week blends conceptual frameworks, hands-on AI-augmented practice, and heavily small-group collaboration that mirrors the real TPM job.

Delivery format

- **Length:** 8 weeks × 5 days × **7 instructional hours/day** (≈280 hours)
- **Daily cadence:** 7 hrs instruction, 1 hr lunch, two 15-minute breaks
- **Style:** Small-group oriented — breakouts, pair critiques, stakeholder simulations, and PRD review cycles
- **Tooling:** Reveal.js decks authored as Markdown under `week-XX/markdown/presentations/day-XX-*.md`, built to standalone `.html` by `npm run build`. Student-facing activity briefs are Markdown under `week-XX/markdown/labs/day-XX-*.md`, with a facilitator-only companion per day under `week-XX/markdown/facilitator/day-XX-*.md`. Authoring details: `course-tooling/tools/AUTHORING.md`.
- **Assessments:** Pre- and post-academy Product Management and Data Literacy assessments (administered on the Skills/SkillIQ platform)

Daily template

Block	Duration	Focus
Opening & objectives	0:15	Frame the day; connect to prior learning
Teaching Block 1 + Activity 1	1:15	Introduce concept → small-group application
Morning break	0:15	
Teaching Block 2 + Activity 2	1:15	Deepen concept → apply to group artifact
Lunch	1:00	
Teaching Block 3 + Activity 3	1:15	New angle → group critique or simulation
Afternoon break	0:15	
Teaching Block 4 + Activity 4 + Wrap	1:30	Integrate → readouts → reflection

Week-by-week topic map

Week	Theme	Capstone checkpoint
1	Customer-Centric Foundations	—
2	Strategic Design & Metrics	—
3	Requirements Engineering & Mini-Capstone	**Non-AI PRD deliverable + peer review**
4	Technical Architecture & Constraints	—
5	Technical Infrastructure & Modeling	—
6	Stakeholder Alignment & Negotiation	—
7	Agile Delivery & ADO Mastery	—
8	AI Spec Development & Capstone	**Real-world capstone + artifact presentations**

Pre-work (~3.5 hours, completed before Week 1)

- Exploring Product Management Philosophies and Frameworks
- Agile Methodologies primer
- Getting Started on Prompt Engineering with Generative AI

- Pre-assessment: Product Management
- Pre-assessment: Data Literacy

    │   └── facilitator/                               ← FACILITATOR-only
companion to labs/
    │       └── day-XX-*.md                            ← cues, answer
keys, timings, reflections
    └── assets/                                        ← per-week
binaries (images, diagrams)
```

After build, the dist/ output (and public mirror) reorganizes for participant browsing:

```
<folder>/
├── presentations/    ← built outputs grouped by format
│   ├── reveal/       (HTML)
│   ├── pdf/          (PDF)
│   └── ppts/         (PowerPoint)
├── labs/             ← flattened out of source markdown/labs/ (student
activities)
├── facilitator/      ← flattened out of source markdown/facilitator/
(facilitator guides)
└── assets/
```

Other instructors get the source `markdown/` layout via the instructor mirror; participants get the flat `presentations/` / `labs/` / `assets/` layout via the public mirror.

How to run a deck

Each deck can be delivered in three formats — pick whichever fits the audience:

Format	Command	When to use
Reveal.js HTML (default)	`npm run build`	Live presentation. Open `dist/<folder>/presentations/reveal/<name>.html` in any browser; press `S` for speaker notes/clock. Self-contained — works offline, no CDN.
PDF + PowerPoint	`npm run pdf`	Both render together in one pass. PDFs land in `dist/<folder>/presentations/pdf/<name>.pdf`, PPTs in `dist/<folder>/presentations/ppts/<name>.pptx`. Both incremental (skip unchanged). Add `-- --force` to re-render everything.
PowerPoint (one-off)	`npm run ppt -- <deck.md>`	Single deck override when you don't need a full PDF rebuild. Output at `dist/<folder>/presentations/ppts/<name>.pptx`. **Lossy** — gradients, cards, multi-column layouts don't survive; content only. PDF is the better visual-fidelity hand-off.

First-time setup for a new instructor

Easiest path — double-click the launcher (no command-line typing):

Platform	Double-click
macOS	`Start.command` (Finder may ask to allow first run — right-click → Open)
Windows	`Start.bat`

A console window opens, runs first-time setup if needed (prereq check + `npm install`), then opens your browser to a build UI at `http://localhost:3000`. The UI has buttons for:

- **Build HTML decks** — all 43 to `dist/<folder>/presentations/reveal/`
- **Build PDF + PowerPoint** — incremental, with a Force button alongside
- **Live preview a deck** — pick from a dropdown, opens reveal-md at `localhost:1948`
- **Open the output folder** — opens `dist/` in Finder / Explorer
- **Curriculum coverage audit** — runs the audit script

Output streams live into the UI; close the console window when done.

Prerequisites the launcher checks for you: Node 18+, Python 3, pandoc. If any are missing it prints the exact install command for your OS.

If you prefer the command line:

```
# macOS / Linux
git clone https://github.com/kiddcorplp/Expeditors_TPM_instructor.git
cd Expeditors_TPM_instructor
./course-tooling/scripts/setup           # checks prerequisites,
installs npm deps
./course-tooling/scripts/preview         # live preview at
http://localhost:1948
./course-tooling/scripts/build-html      # all HTML decks
./course-tooling/scripts/build-pdf       # all PDFs + PPTs
```

```
REM Windows
git clone https://github.com/kiddcorplp/Expeditors_TPM_instructor.git
cd Expeditors_TPM_instructor
course-tooling\scripts\setup.cmd
course-tooling\scripts\preview.cmd
course-tooling\scripts\build-html.cmd
course-tooling\scripts\build-pdf.cmd
```

If you prefer the underlying npm scripts:

```
# Prerequisites: Node 18+, Python 3 (for audit), pandoc (for PPT)
npm install                                                          #
one time
npm run build                                                        #
all HTML decks
npm run pdf                                                          #
all PDFs + PPTs (incremental, add -- --force to rebuild)
npm run dev                                                          #
live preview
npm run audit                                                        #
curriculum coverage check
```

Detailed setup walkthrough and per-tool install commands: `course-tooling/tools/AUTHORING.md`.

CI behavior

The HTML build runs in CI on every push to `main`. PDFs and PPTs render together in CI on manual workflow dispatch — they're produced in the same pass. PPTs are skipped if you don't have `pandoc` installed locally (PDF-only still works via the bundled Chromium).

One-deck PPT override

```
npm run ppt -- week-01/markdown/presentations/day-01-ai-fundamentals-prompting.md
```
