

The 5 Saved Queries Every Team Needs (WIQL)

Day 2 · Activity 3 handout. Build and save these five queries in ADO. Fill the <our area> placeholders with your triad's area path. Save them all in a shared folder with clear names.

1. What's open in the current sprint?

```
Type: User Story or Task  
State: New / Active  
Iteration Path: Current  
Area Path: Under <our area>
```

Used: every standup.

2. What's blocked?

```
Type: User Story or Task  
State: Active  
Tags: Contains "blocked"
```

Used: daily; surfaces dependencies that are stuck.

3. What's done in this sprint?

```
Type: User Story  
State: Closed  
Iteration Path: Current  
Area Path: Under <our area>
```

Used: end-of-sprint review; outcome verification.

4. What hasn't been touched in N days?

```
Type: User Story or Task  
State: Active  
Changed Date: < (Today - 7 days)
```

Used: weekly; catches forgotten work.

5. What's in this NFR / quality category?

```
Type: User Story  
Tags: Contains "non-functional" OR "security" OR "compliance"  
State: Not Closed
```

Used: monthly; ensures NFRs aren't being deferred indefinitely.

After you build them

- All 5 queries are **saved and named clearly** in a shared folder.
- Set up the **sprint board**: columns To Do / In Progress / In Review / Done, with WIP limits where appropriate (e.g., max 3 In Progress per developer).
- Set up the **Kanban board** for the whole Feature (same columns; this view spans the feature, not just one sprint).
- Each triad member: pick the **one query you'd run every morning**. Discuss and converge.
