Product Analytics Export — FieldPulse Dispatcher App

Ambient context introduced Day 1; the section-time chart is used Day 3, the reconcile funnel Day 4. Two aggregated views from the dispatcher web app. Analytics tell you **what** happens, not **why** — pair every number here with a quote or observation before you call it a pain. Aggregated across 90 dispatchers over a 30-day window; no individual is identifiable.

View 1 — Average time-in-app per section (per dispatcher, per day)

Where dispatchers actually spend their time in the product. Minutes/day, averaged across 90 dispatchers.

Section	Avg min/day	Relative
Dispatch / schedule board	47	
End-of-day reconcile	38	
Job detail	21	
Reports	9	
Inventory	6	
Messaging	5	

Reading note: the reconcile section consumes nearly as much time as the core dispatch board, and far more than inventory or messaging — despite reconcile being a once-a-day task and dispatch being all-day. What that *means* is for you to determine.

View 2 — End-of-Day Reconcile funnel (7 steps)

Share of started reconcile sessions that reach each step. Same 30-day window, 90 dispatchers, ~2,400 reconcile sessions.

Step	Stage	% of sessions reaching step
1	Open reconcile	100%
2	Review completed jobs	96%
3	Match field tickets	88%
4	Confirm parts used	35%
5	Adjust job times	31%
6	Sign-off	29%
7	Submit	27%

Headline: ~65% of reconcile sessions are abandoned at step 4 (“Confirm parts used”) — the single largest drop in the flow. Only about 1 in 4 sessions reach Submit inside the app. Where the other sessions go (paper? spreadsheet? next morning?) is not visible in this export — that’s a question for the interviews and tickets.

View 3 — Field-submit success rate (technician mobile app)

Supporting cut, included for context. Share of field ticket-submit attempts that succeed on first try, by connectivity.

Connectivity	First-try submit success
Strong signal (Wi-Fi / LTE)	94%
Weak signal (1–2 bars)	41%
No signal (offline attempt)	6%

Methodology: event data from the dispatcher web app and technician mobile app, 30-day window, aggregated across 90 dispatchers and their technicians. Percentages rounded. This export is descriptive only — it contains no conclusions and no prioritization.
