

Day 3 — Documenting Non-Functional Requirements · Facilitator Guide

Companion to `labs/day-03-nfrs.md` . Facilitator-only — do not hand to participants.

Activity 1 — NFR Triage

Cues:

- Boilerplate NFRs are usually the result of "we copied the template" — surface this openly.
- The "wrong category" failure is sneaky — surfaces only when you ask "what would a Performance test for this look like?"

Answer key / watch-for: The 10-item NFR Triage Pack maps each example to one (or more) of the five failure modes printed in the student packet — Boilerplate, Unmeasurable, No defense, No verification, Wrong category. Only a few items are clean; most carry at least one failure. When quads mark an item "clean," pressure-test it against the "what would the test look like?" question before accepting the call.

Activity 2 — Performance + Observability NFRs

Cues:

- "Average" latency targets get pushed to p95 — average lies in bimodal distributions.
- If observability NFRs don't reference the Tier Sheet signals, the quad is observability-theater; redirect.

Activity 3 — Security + Accessibility + Compliance

Cues:

- "Security: the system shall be secure" gets a hard "no" — push for specifics.
- If a quad has no compliance NFR — ask: "If a regulator audited this feature, what would they ask?" That answer is the NFR.
- A11y is the most-skipped. If a quad omits it, redirect to Week 2 Day 3 work.

Activity 4 — NFR Cross-Review + Trade-Off Discussion

Cues:

- Quads who claim "no trade-offs" haven't read their own NFRs hard enough; surface one for them.
- The most useful trade-off is one resolved with a deferred plan, not a hand-wave; coach toward specificity.

Facilitator reflection prompts (end of day)

- Which quad's defenses were strongest? Hold up Friday as positive example.
- Which quad has the most boilerplate? Coach privately tomorrow morning.
- Did anyone skip Compliance? Probably yes. Surface tomorrow.
- Did anyone use AI? Last day to course-correct.
