

Friday TMD Rubric

Day 5 handout. The six dimensions your TMD is scored on in Friday's cross-review — with weights and what "exemplary" looks like in each. Use it as the floor when you self-review, and as the scoring sheet when you review another quad.

Dimension	Weight	What "exemplary" looks like
Data model clarity	20%	Entities, keys, indexes, trade-offs all named
Cloud topology realism	15%	Region/AZ stance fits SLOs; tenancy honest
API contract sharpness	20%	Resources noun-shaped; idempotency, errors, versioning explicit
Sequence model completeness	20%	Happy + sad/weird; protocols + invariants
Baselines + monitoring	15%	Baselines real; alerts pass 4-question test
AI-validation discipline	10%	Log distinguishes correct / partly correct / wrong with evidence

How to use it

1. **Solo read-through** — each member reads Sections 1–5 and marks coherence issues.
2. **Pool issues** — de-dupe as a quad.
3. **Cross-review** — pair with another quad; the reviewer scores each dimension against the "exemplary" column.
4. **Adopt / defer / reject** the findings.
5. **Sign-off** — status is either **"Approved"** or **"Approved with gaps."**

The honesty check

"Approved" without an honest gap list inflates confidence. Treat the rubric as the **floor**, not the ceiling — and name your gaps.
