

Day 1 — Identifying & Mapping Key Stakeholders

Activity packet for participant quads. Today's job: take the TCD Section 6 sign-off matrix, expand it into a real stakeholder map (Power × Interest + RACI), and draft SEP Section 1.

Where we are in the week

The TCD already has Section 6 — a sign-off matrix listing constraints and owners. That matrix is the **starting input** to today's work. Today expands it into a usable map: who has what kind of power, who cares how much, who is Responsible, Accountable, Consulted, or Informed.

By 16:00, every quad has SEP Section 1 — a stakeholder map ready to drive engagement planning tomorrow.

Inputs

- TCD Section 6 (stakeholder sign-off matrix from Week 4 Day 5)
- PRD Section 10 (named dependencies + owners)
- The quad's customer interviews (Week 1) for stakeholder context

Why "stakeholder mapping" is not org-chart copying

A common rookie mistake: list the team names from the org chart and call it a stakeholder map. That's not a map — it's a directory.

A real stakeholder map answers:

- **Who has the power to block this work?**
- **Who cares whether it ships?**

- **Whose buy-in do we *need*?** (vs whose buy-in is *nice-to-have*?)
- **Who must be consulted vs only informed?**
- **Who do we wish we could ignore but can't?**

Org charts answer "who reports to whom." Maps answer "whose attention do we need to manage and how?"

The Power × Interest Grid (today's first frame)

A 2×2 placing every stakeholder by:

- **Power:** how much can they affect this work? (block it, fund it, redirect it, accelerate it)
- **Interest:** how much do they care about this work?

Each quadrant suggests an engagement style:

Quadrant	Engagement style
High power, high interest	Manage closely — frequent, deep engagement
High power, low interest	Manage with authority — keep them out of weeds; surface only when needed
Low power, high interest	Keep informed — engaged audience; you'll learn from them
Low power, low interest	Monitor — low effort; check in periodically

Most TPMs over-invest in the high-interest quadrants and under-invest in the **high-power-low-interest** quadrant. That's the quadrant that surprises you with a "no" at the worst time.

The RACI assignment (today's second frame)

Once stakeholders are placed on the grid, assign their role for **specific decisions** in the project:

Letter	Role	Definition
R	Responsible	Does the work. There can be many R's.
A	Accountable	Owns the outcome. Exactly one person per decision.
C	Consulted	Two-way conversation; opinion sought.
I	Informed	One-way notification; outcome shared.

The discipline: **one A per decision**. If two people are A, neither is. If no one is A, the decision will rot.

For a single feature, several decisions need RACI:

- The **scope** of the feature
- The **architecture** (TCD Section 1 stance)
- The **SLO targets**
- The **launch date**
- Each **out-of-scope follow-up** (deferred to a backlog with an owner)

Activity 1 — Build the Stakeholder List

Format: Quad • 35 min • Block 1

Purpose

Build a **complete** stakeholder list before mapping. Most quads will start with 5–7 stakeholders and discover they have 12–15.

Quad protocol

1. **Start with TCD Section 6** (5 min). Copy every stakeholder name from the sign-off matrix into a list.
2. **Augment with the "five circles"** (15 min). For each circle, add anyone who isn't already on the list:
 - **Customer-facing:** customer success, sales, support
 - **Engineering-adjacent:** architecture, security, platform, infra, data, QA
 - **Operating partners:** ops, IT, compliance, legal, finance
 - **Decision-makers:** PM lead, eng director, GM, executive sponsor
 - **Indirect interest:** other product teams whose work this touches
3. **Cull lightly** (5 min). Anyone who genuinely doesn't need to be on the list, drop. Default: keep.
4. **Capture context per stakeholder** (10 min). For each, one sentence:
 - What's their role on this feature?
 - What do they care about most?

Output

A **comprehensive stakeholder list** (typically 10–18 names) with role + concern.

Activity 2 — Power × Interest Mapping

Format: Quad • 40 min • Block 2

Purpose

Place each stakeholder on the 2x2 grid. The discussion of *where* each one goes is most of the learning.

Quad protocol

1. **Sketch the 2x2** on whiteboard or paper (5 min).
2. **Place each stakeholder with a sticky note** (15 min).
Argue when you disagree — don't average.
3. **Highlight the four corners** (10 min). For each quadrant:
 - Who is here?
 - What does our engagement style with them need to look like?
4. **Identify the 2 "surprises"** (10 min). Usually:
 - One person you thought was high-power who actually isn't (their veto isn't real)
 - One person you thought was low-interest who actually isn't (they care more than they let on)

What "good" looks like

- **All four quadrants populated** (if your "low power / low interest" is empty, you've over-prioritized)
- **Discussion happened** — quads converged on placements through argument, not by the loudest voice
- **Engagement style** is named per quadrant
- **The two surprises** are flagged — these are your high-leverage discoveries

Worked example — FieldPulse reconcile

The "surprise" for FieldPulse: **Compliance** is low-interest in the abstract but **high-power in specific moments** (audit deadlines). Its position can shift; flag it.

Activity 3 — RACI Assignment for Five Decisions

Format: Quad • 40 min • Block 3

Purpose

Assign RACI to the five most consequential decisions for the feature.

The five decisions

For most features:

1. **Scope** — what's in vs out
2. **Architecture** — TCD Section 1 stance + key trade-offs
3. **SLO targets** — TCD Section 4

4. **Launch date** — when it ships
5. **Out-of-scope follow-up backlog** — deferred items + owners

The matrix template

```
| Decision | R | A | C | I |
|-----|---|---|---|---|
| Scope | TPM (you) | PM Director | Eng Lead,
Architect, Customer Success | Sales, Support |
| Architecture | Architect | Eng Director | TPM,
Security, Platform | All eng |
| SLO targets | Eng Lead | TPM | SREs, Customer
Success | Eng Director |
| Launch date | TPM | PM Director | Eng Lead,
Customer Success, Marketing | All eng, Sales |
| OOS backlog ownership | TPM | TPM | Eng Lead |
Backlog readers |
```

Quad protocol

1. **Draft the matrix** (20 min). One A per decision. Multiple R/C/I OK.
2. **The "no two A's" check** (5 min). Walk the columns; verify exactly one A per decision.
3. **The "is the A actually empowered?"** (10 min). For each A, check: do they have the authority (formal + informal) to make the call? If not, reassign.
4. **The "anyone surprised by being I?"** (5 min). Often a stakeholder gets I when they think they're C. Surface that and decide.

Activity 4 — SEP Section 1 Polish + Stakeholder Watch List

Format: Quad • 45 min + Wrap • Block 4

Purpose

Polish Section 1 of the SEP, plus identify a **watch list** of stakeholders whose status could change in the next month.

The watch list

For each stakeholder in the **high-power-low-interest** quadrant, ask:

- What event would move them to **high-interest**?
- What's our trigger to escalate engagement?

Examples:

- **CFO** — currently low-interest. Would move to high-interest if quarterly cost forecasts change. Trigger: cost projection > \$X.
- **General Counsel** — currently low-interest. Would move to high-interest if a regulator inquires. Trigger: any regulator email.
- **Chief Customer Officer** — currently low-interest. Would move to high-interest if a top-10 account complains. Trigger: top-10 escalation.

A watch list is the early-warning system. It's the section that distinguishes a TPM who manages stakeholders from one who reacts to them.

Quad protocol

1. **Polish Section 1** (15 min). Combine list + Power×Interest grid + RACI into one section. Add the "two surprises" callouts.
2. **Build the watch list** (20 min). 3–5 stakeholders with their triggers.
3. **Cross-check against the TCD Section 6 sign-off matrix** (5 min). Anyone in Section 1 not on Section 6? Add to Section 6. Anyone on Section 6 not in Section 1? Add to Section 1.
4. **AI cross-check** (5 min). Run the prompt below.

AI prompt

Role: Senior PM coaching a junior TPM on stakeholder management.

Context: <paste the stakeholder list with quadrants and RACI>

Task: Identify 3 likely blind spots:

1. A stakeholder who probably has more power than the map shows
2. A decision where the A is wrong or absent
3. A high-power-low-interest stakeholder whose trigger isn't named

Constraints:

- Be specific to the names and roles given
- Do not invent stakeholders

Format: 3 numbered findings, each with a one-sentence rationale.

Wrap (last 15 min)

Each quad shares:

- One stakeholder whose quadrant placement was the most contested
- One RACI-A that was reassigned during discussion
- One trigger from the watch list

End-of-day checkpoint

Each quad ends Day 1 with:

- ✓ Comprehensive stakeholder list with role + concern
- ✓ **Power x Interest grid** populated
- ✓ **RACI matrix** for 5 decisions, with one A per decision
- ✓ **Watch list** of high-power-low-interest stakeholders + triggers
- ✓ AI provenance log entry
- ✓ SEP Section 1 drafted
