

Pattern Library — Cumulative Scaffold (Weeks 2–8)

Day 5 handout. The Pattern Library is the running collection of *validated prompts and reusable techniques* your quad accumulated week by week — the reusable "moves," not the artifacts themselves. This scaffold is the **structure to assemble yours in**, not a finished library. Fill it from your own quad's notes across the academy; only your quad knows which patterns actually earned their place.

What the Pattern Library is

- A **quad-owned** collection of the prompts and techniques that worked — the ones you'd reach for again.
- Each entry is a **reusable pattern**: what it's for, the prompt or move itself, and the validation step that keeps it honest.
- It is **not** a re-list of your artifacts (those are the outputs). It's the *methods* that produced them.
- It grows week over week. Week 8 doesn't create it — it **completes and hands it back** to you.

Where your entries come from

Week	Muscle that produced patterns	Look in your notes for...
Week 2	Metrics, North Star, journey mapping	Prompts that stress-tested a metric or drafted a journey
Week 4	Architecture, security, SLOs, trade-offs	Prompts that surfaced threats or framed a trade-off
Week 5	Data, cloud, APIs, modeling, AI validation	The AI-validation-log discipline; API/data synthesis prompts
Week 6	Stakeholder mapping, trade-off comms, negotiation	Prompts that translated a trade-off into a stakeholder's currency
Week 7	Outcomes, ADO, output-vs-outcome, VSM	Prompts that reframed output into outcome; backlog-shaping moves
Week 8	AI Spec, compression, technical logic validation	The 5-prompt AI Spec sequence; the 7-point validation walk

(Week 1 was pre-AI-pattern discovery groundwork; Week 3 folded into the PRD templates. Patterns first accumulate from Week 2.)

Entry template — copy this per pattern

```
### Pattern: <short name>
**Introduced:** Week <n>, Day <n>
**Use when:** <the situation that calls for it>
**The pattern (prompt or move):**
<the actual prompt text, or a description of the technique>
**Validation step:** <how you check the output before trusting it>
**Watch-out:** <the failure mode that shows up under time pressure>
```

Assembly protocol (for your quad)

1. **Gather** — each member pulls the prompts/techniques they logged across Weeks 2–8.
 2. **Dedupe** — keep the strongest version of each pattern; merge near-duplicates.
 3. **Test the "reusable" bar** — a real pattern is one you'd use again on a *different* product. If it only worked once for FieldPulse, it's a note, not a pattern.
 4. **Order by workflow** — discovery → requirements → architecture → modeling → stakeholders → delivery → integration — so the library reads like the flow of a real project.
 5. **Keep the validation step on every entry.** A prompt without its validation step is the fiction the academy trained you to catch.
-

The bar to clear

When you're done, a TPM who *wasn't* in your cohort should be able to open your Pattern Library, pick one entry, and use it on their own product this week — prompt, validation step, and watch-out included.
