

# Day 4 — High-Level Technical Modeling · Facilitator Guide

Companion to `labs/day-04-technical-modeling.md` . Facilitator-only — do not hand to participants.

## Activity 1 — Happy-Path Sequence

---

### Cues:

- If a triad's diagram has more than 12 lifelines, push them: "is anything here repeating? can two be merged?"
- If a triad omits the audit publish, surface it — that's a typical compliance miss.
- The total-latency annotation at the bottom is the consistency check with TCD §4.

## Activity 2 — Sad-Path Sequence

---

### Cues:

- Sad paths that end in a generic 500 hide error semantics. Push to the specific 4xx code from TMD §3.
- Recovery paths that read "user gets frustrated" are dead-ends; force a recoverable action.

## Activity 3 — Weird-Path Sequence

---

### Cues:

- Triads who cannot state the invariant haven't designed the weird path. Push for the explicit promise.
- Diagrams that grow longer than the happy path usually re-state shared steps; coach toward the divergence.

## Activity 4 — Cross-Review + AI Sequence Critique

---

### Cues:

- Generic AI findings ("add error handling") signal weak prompts. Coach the Critique-hat pattern with diagram text loaded.
- Reviews that pass everything are calibrated low. Force at least one named gap per pair.

## End-of-day reflection prompts

---

- Which triad's invariant was the most useful? Surface as Friday positive.
- Did anyone forget the audit publish in the happy path? Common compliance miss.
- Did anyone produce 25-lifeline mega-diagrams? Coach toward simplification.

- Did the AI surface a weird path the cohort hadn't considered? That's the most useful kind of finding.
