

Facilitator answer key — Holocron capstone worked solution.
Facilitator-only — lives in the facilitator folder of every repo; do not hand to participants. Part of the internally-consistent set in this folder (see `README.md`).

SEP-light — Holocron source-string delivery (release 1)

1. Stakeholder map

RACI is for the single most consequential decision: **adopt the Redis read-cache delivery path with ≤ 60 s propagation (§2).**

Stakeholder	Power / Interest	Engagement (one line)
Anna Woods — Product; scope + MDM/RDM	High / High	Decision-driver; frames the scope line, arbitrates freshness-vs-latency.
Nick Grant — Engineering; delivery mechanism ★	High / High	Co-owns the trade-off; brings the cache design; frame SLOs with him before Legal.
Legal / Compliance — audit + review gates ★	High / High	Manage closely; speak in risk/exposure; get the staleness window signed in writing.
Enterprise Infrastructure — Entra ID + AKS	High / Low	Keep satisfied; lead time on identity/provisioning asks; not in product trade-offs.
Architecture — key/namespace governance	Med / High	Consult on key-schema + cache keying before the publish contract locks.
Chance Kennedy — future AI/Figma (out of R1)	Low / Low	Monitor; re-engage when the AI-assist slice opens.

RACI — "Adopt Redis read-cache with ≤ 60 s propagation":
Anna Woods **A** · Nick Grant **R** · Legal/Compliance **C** (must sign the staleness window) · Enterprise Infra **I** · Architecture **C**.

2. Trade-off brief — for Legal/Compliance (in their currency)

Decision. Consuming apps read published strings from a fast in-memory copy (Redis) instead of the system of record on every read — serving 20+ apps at p95 ≤ 200 ms and 99.9% availability. **Cost:** after a publish, the copy apps see can lag the true value by up to **60 seconds**. **Why it matters (exposure).** On a normal label, harmless. On a **compliance-sensitive string** — a legal disclaimer, a regulated notice — that 60-second window is exposure: apps can still render the *old* text after Legal has approved the new one. **The ask.** Accept ≤ 60 s for **normal** strings in exchange for the latency and scale, and

tell us which strings are compliance-critical so we can treat them differently. Revisit the whole trade-off if any consumer needs sub-5-second freshness across the board.

3. Simulated negotiation outcome

Status vocabulary: PROPOSED → COUNTERED → AGREED (with DEFERRED / ESCALATE).

- **PROPOSED:** Product/Eng propose Legal accept $\leq 60s$ propagation across all published strings, for p95 $\leq 200ms$ + read scale.
- **COUNTERED:** Legal's strongest objection — "A 60-second window where apps still render a superseded legal string after we've published a correction is unacceptable. We can't sign a blanket staleness window." No objection to the cache for ordinary content.
- **AGREED:** $\leq 60s$ stands as the **default** for normal strings. Compliance-critical strings carry a **critical/legal flag**; flagging one forces (a) a **required compliance review before publish** — publish blocked until Legal signs — and (b) **synchronous cache invalidation (<5s)** rather than lazy $\leq 60s$ refresh. Anna Woods **A**, Nick Grant **R** for the flag-driven invalidation, Architecture **C** on carrying the flag in the key schema.
- **Audit / next step:** Decision recorded with the flag semantics + <5s target; the required-review gate logs to the audit-retention trail Legal owns. **DEFERRED** : if any consumer later needs sub-5s for *unflagged* strings, the base $\leq 60s$ trade-off reopens (owner: Nick Grant). No **ESCALATE** — settled at the working level.
