

AC Triage Pack

Day 2 · Activity 1 handout. Twelve Acceptance Criteria drawn from real (anonymized) FieldPulse PRDs. Some are clean. Some carry one of the 5 failure modes. A few carry more than one. **Your job:** for each, decide which failure mode(s) are present (or mark it clean), then rewrite every failing one. No labels are provided — the judging is the work.

The 5 failure modes to check against: ① **Vague** · ② **Untestable** · ③ **Restating the goal** · ④ **Multi-condition (AND-soup)** · ⑤ **Implementation-prescriptive**.

AC-1

Given a dispatcher on the End-of-Day Reconcile summary
When they tap "Reconcile all"
Then the reconcile modal opens quickly with everything ready to go

AC-2

Given a dispatcher with 3 open tickets on the summary screen
When they tap "Reconcile all"
Then the modal opens with all 3 tickets pre-selected
and the header shows the count "3 selected"

AC-3

Given any dispatcher using the reconcile flow
When they complete their end-of-day work
Then they feel confident payroll will run clean on Wednesday

AC-4

Given a dispatcher submits a reconcile batch during a network drop
When the submit request fails to reach the server
Then the payload is queued using an IndexedDB write-behind buffer
and replayed over a WebSocket once connectivity returns

AC-5

Given a dispatcher with 0 open tickets on the summary screen
When they tap "Reconcile all"
Then a non-modal toast appears reading "No tickets to reconcile"
and the dispatcher remains on the summary screen

AC-6

Given a tech's truck-stock quick view
When the dispatcher opens it during job assignment
Then the reconcile process becomes faster and re-routes go down

AC-7

Given a reconcile ticket missing its labor-time entry
When the dispatcher opens the pre-submit confidence banner
Then the banner lists that ticket under "Incomplete"
and a "Jump to fix" action focuses the missing labor-time field

AC-8

Given a dispatcher and a shop manager both editing the same re-route
When the dispatcher saves first and the manager saves 200ms later
Then the manager's save is rejected with a "This re-route changed – reload" message
and the manager's board refreshes to the dispatcher's version

AC-9

Given the reconcile feature is live
When a dispatcher uses it
Then the experience should be intuitive and error handling should be robust
and the flow should be accessible
and performance should be good

AC-10

Given a re-route was performed 45 seconds ago
When the dispatcher taps "Undo"
Then the re-route is reversed
 and the tech's original assignment is restored on the board
 and an entry "re-route undone" is appended to the visible re-route log

AC-11

Given a dispatcher whose role lacks the reconcile.write scope
When they tap "Reconcile all"
Then the action is blocked and a message explains they lack permission to submit reconciles

AC-12

Given a reconcile batch of 47 tickets (more than the modal lists at once)
When the dispatcher taps "Reconcile all"
Then the modal opens with the first 25 tickets pre-selected
 and a banner reads "22 more tickets – load more"
 and tapping the banner appends the next 25 below

Triage worksheet

AC	Failure mode(s) or "clean"	If failing: your rewrite
1
