

AI-Summary Validation Log

Day 5 handout. This week's new discipline. AI is used to summarize dashboards, query results, and metric reports — the TPM job is to validate each summary against the source data and document the result. This log is cumulative across weeks.

For each AI-assisted summary used in any week's artifact, capture one row.

#	Summary purpose	Prompt (link)	Source data	Validation

Why this matters — the failure modes

Failure	What happens
Wrong number	AI cites "p95 = 800ms" when the chart shows 1200ms
Wrong direction	AI says "improving" when the trend is flat or declining
Wrong attribution	AI explains a spike with the wrong cause
Missing context	AI summarizes the headline; misses the relevant footnote

Status values (use these in the Validation column)

- **Cross-checked all citations** — best; every claim verified against source.
- **Spot-checked** — rougher; N claims sampled and verified.
- **Adopted with rationale** — used the suggestion; correctness was self-evident or cheap to verify.
- **Pending** — used as input but not yet validated; **must have a deadline**.
- **Rejected** — output was wrong; cut.

What "good" looks like

- Every AI use across the weeks has a **row** — enumerate from the Pattern Library, don't just log what you remember.

- Status values are **honest** (distinguish correct / partly correct / wrong, with evidence).
- Every **Pending** entry has a **named deadline** — Pending without a date becomes permanent.
- The log is a tool the **next TPM can audit**, not a checkbox.
