

Power x Interest Grid

Day 1 · Activity 2 handout. The 2x2 frame for placing every stakeholder by how much they can affect the work (power) and how much they care about it (interest). Sketch this on a whiteboard or print it and place a sticky per stakeholder.

The grid

What each axis means

- **Power** — how much can they affect this work? Can they block it, fund it, redirect it, accelerate it?
- **Interest** — how much do they care whether this ships?

Engagement style by quadrant

Quadrant	Engagement style
High power, high interest	Manage closely — frequent, deep engagement
High power, low interest	Manage with authority — keep them out of the weeds; surface only when needed
Low power, high interest	Keep informed — engaged audience; you'll learn from them
Low power, low interest	Monitor — low effort; check in periodically

The quadrant that bites you

Most TPMs over-invest in the high-interest quadrants and under-invest in **high-power / low-interest**. That is the quadrant that surprises you with a "no" at the worst possible time. A stakeholder here can shift into high-interest the moment their trigger fires (an audit deadline, a cost spike, a top-account escalation) — see the watch list.

Worked example — FieldPulse "End-of-Day Reconcile"

The FieldPulse "surprise": **Compliance** looks low-interest in the abstract but becomes **high-power in specific moments** (audit deadlines). Its position can shift — flag it on the watch list.

Place your stakeholders

For each stakeholder, note the quadrant and one sentence of engagement style.

Stakeholder	Quadrant	Engagement style

The two surprises to flag

- One person you thought was high-power who actually isn't (their veto isn't real): _____
- One person you thought was low-interest who actually isn't (they care more than they let on): _____
