

Outcome Map Template (DP Section 1)

Day 1 · Activity 2 handout. Fill this in for your triad's feature: the outcomes it is meant to produce — not the outputs it will ship.

Pull the primary outcome directly from your NS / Tier Sheet / journey map. Every outcome should have a Tier Sheet metric attached. If your primary outcome is "the feature is shipped," you have named an output — try again.

```
## DP Section 1 – Outcome Map
```

```
### Primary outcome (the one we're staking the feature on)
> <user-visible outcome statement>
> Tied to: <NS / KPI from Tier Sheet>
> Target movement: <baseline → target> by <timeline>
> Leading indicator: <what we'd watch first to know we're on track>
```

```
### Supporting outcomes (2–4)
For each:
> <outcome statement>
> Tied to: <Tier Sheet metric>
> Why it matters: <one sentence>
```

```
### Counter-outcomes (the guardrails)
> <outcome we DON'T want to produce – if this happens, we won
> for the wrong reasons>
```

```
### What this feature explicitly does NOT outcome on
> <claims we are NOT making – usually pulled from PRD Section 3 non-
goals>
```

What "good" looks like

- The primary outcome is **not** "the feature is shipped."
- Supporting outcomes are **fewer than 5** and named in user terms.
- Counter-outcomes prevent gaming — they name the "we cheated" way to hit the number.
- The "explicitly NOT" line catches stakeholders who would otherwise expect more.

Fill-in order (suggested)

1. Pull the **primary outcome** from your NS (10 min). It should be movement on a Tier Sheet operational signal, on a KPI, or (rarely) on the NS itself.
2. List **supporting outcomes** (10 min) — 2–4 outcomes the feature contributes to without owning.
3. Name **counter-outcomes** (10 min) — the guardrails, from your NS Defense Card.
4. Name what you are **NOT outcoming on** (5 min) — this catches scope creep before it ships.
5. **Sanity check** (5 min): does each outcome have a Tier Sheet metric attached?
